Package 'DataExplorer'

January 7, 2020

Title Automate Data Exploration and Treatment

Version 0.8.1

Description Automated data exploration process for analytic tasks and predictive modeling, so that users could focus on understanding data and extracting insights. The package scans and analyzes each variable, and visualizes them with typical graphical techniques. Common data processing methods are also available to treat and format data.

Depends R (>= 3.5)

Imports data.table (>= 1.12.8), reshape2 (>= 1.4.3), scales (>= 1.1.0), ggplot2, gridExtra, rmarkdown (>= 2.0), networkD3 (>= 0.4), stats, utils, tools, parallel

Suggests testthat, covr, knitr, jsonlite, nycflights13

SystemRequirements pandoc (>= 1.12.3) - http://pandoc.org

License MIT + file LICENSE

Language en-US

DataExplorer-package Data Explorer

Description

Simplify and automate EDA process and report generation.

Details

Data exploration process for data analysis and model building, so that users could focus on understanding data and extracting insights. The package automatically scans through each variable and does data profiling. Typical graphical techniques will be performed for both discrete and continuous features.

configure_report 3

configure_report

Configure report template

Description

This function configures the content of the to-be-generated data profiling report.

Usage

```
configure_report(
  add_introduce = TRUE,
  add_plot_intro = TRUE,
  add_plot_str = TRUE,
  add_plot_missing = TRUE,
  add_plot_histogram = TRUE,
  add_plot_density = FALSE,
  add_plot_qq = TRUE,
  add_plot_bar = TRUE,
  add_plot_correlation = TRUE,
  add_plot_prcomp = TRUE,
  add_plot_boxplot = TRUE,
  add_plot_scatterplot = TRUE,
  introduce_args = list(),
  plot_intro_args = list(),
  plot_str_args = list(type = "diagonal", fontSize = 35, width = 1000, margin =
    list(left = 350, right = 250)),
  plot_missing_args = list(),
  plot_histogram_args = list(),
  plot_density_args = list(),
  plot_qq_args = list(sampled_rows = 1000L),
  plot_bar_args = list(),
  plot_correlation_args = list(cor_args = list(use = "pairwise.complete.obs")),
  plot_prcomp_args = list(),
  plot_boxplot_args = list(),
  plot_scatterplot_args = list(sampled_rows = 1000L),
  global_ggtheme = quote(theme_gray()),
  global_theme_config = list()
)
```

Arguments

```
add_introduce add introduce? Default is TRUE.

add_plot_intro add plot_intro? Default is TRUE.

add_plot_str add plot_str? Default is TRUE.

add_plot_missing

add plot_missing? Default is TRUE.
```

4 configure_report

```
add_plot_histogram
                  add plot_histogram? Default is TRUE.
add_plot_density
                 add plot_density? Default is FALSE.
                 add plot_qq? Default is TRUE.
add_plot_qq
add_plot_bar
                 add plot_bar? Default is TRUE.
add_plot_correlation
                 add plot_correlation? Default is TRUE.
add_plot_prcomp
                  add plot_prcomp? Default is TRUE.
add_plot_boxplot
                 add plot boxplot? Default is TRUE.
add_plot_scatterplot
                 add plot_scatterplot? Default is TRUE.
introduce_args arguments to be passed to introduce. Default is list().
plot_intro_args
                 arguments to be passed to plot_intro. Default is list().
                 arguments to be passed to plot_str. Default is list(type = "diagonal", fontSize
plot_str_args
                  = 35, width = 1000, margin = list(left = 350, right = 250)).
plot_missing_args
                 arguments to be passed to plot_missing. Default is list().
plot_histogram_args
                  arguments to be passed to plot histogram. Default is list().
plot_density_args
                 arguments to be passed to plot_density. Default is list().
                 arguments to be passed to plot_qq. Default is list(sampled_rows = 1000L).
plot_qq_args
plot_bar_args
                 arguments to be passed to plot_bar. Default is list().
plot_correlation_args
                 arguments to be passed to plot_correlation. Default is list("cor_args" =
                 list("use" = "pairwise.complete.obs")).
plot_prcomp_args
                 arguments to be passed to plot_prcomp. Default is list().
plot_boxplot_args
                  arguments to be passed to plot_boxplot. Default is list().
plot_scatterplot_args
                 arguments to be passed to plot_scatterplot. Default is list(sampled_rows =
                  1000L).
global_ggtheme global setting for theme. Default is quote(theme_gray()).
global_theme_config
                 global setting for theme. Default is list().
```

create_report 5

Note

Individual settings will overwrite global settings. For example: if plot_intro_args has ggtheme set to theme_light() while global_ggtheme is set to theme_gray(), theme_light() will be used.

When setting global themes using global_ggtheme, please pass an unevaluated call to the theme function, e.g., quote(theme_light()).

See Also

```
create_report
```

Examples

```
## Get default configuration
configure_report()

## Set global theme
configure_report(global_ggtheme = quote(theme_light(base_size = 20L)))
```

create_report

Create report

Description

This function creates a data profiling report.

Usage

```
create_report(
  data,
  output_format = html_document(toc = TRUE, toc_depth = 6, theme = "yeti"),
  output_file = "report.html",
  output_dir = getwd(),
  y = NULL,
  config = configure_report(),
  report_title = "Data Profiling Report",
  ...
)
```

Arguments

6 create_report

```
y name of response variable if any. Response variables will be passed to appropriate plotting functions automatically.

config report configuration generated by configure_report.

report_title report title. Default is "Data Profiling Report".

other arguments to be passed to render.
```

Details

config is a named list to be evaluated by create_report. Each name should exactly match a function name. By doing so, that function and corresponding content will be added to the report. If you do not want to include certain functions/content, do not add it to config.

configure_report generates the default template. You may customize the content using that function.

All function arguments will be passed to do.call as a list.

Note

If both y and plot_prcomp are present, y will be removed from plot_prcomp.

If there are multiple options for the same function, all of them will be plotted. For example, $create_report(...,y="a",config=list("plot_bar"=list("with"="b")))$ will create 3 bar charts:

- · regular frequency bar chart
- bar chart aggregated by response variable "a"
- bar chart aggregated by 'with' variable "b"'

```
configure_report
```

drop_columns 7

```
# Create customized report for diamonds2 dataset
create_report(
  data = diamonds2,
  output_format = html_document(toc = TRUE, toc_depth = 6, theme = "flatly"),
  output_file = "report.html",
  output_dir = getwd(),
  y = "price",
  config = configure_report(
    add_plot_prcomp = TRUE,
   plot_qq_args = list("by" = "cut", sampled_rows = 1000L),
   plot_bar_args = list("with" = "carat"),
   plot_correlation_args = list("cor_args" = list("use" = "pairwise.complete.obs")),
   plot_boxplot_args = list("by" = "cut"),
   global_ggtheme = quote(theme_light())
  )
)
## Configure report without `configure_report`
config <- list(</pre>
  "introduce" = list(),
  "plot_intro" = list(),
  "plot_str" = list(
    "type" = "diagonal",
    "fontSize" = 35,
    "width" = 1000,
    "margin" = list("left" = 350, "right" = 250)
  ),
  "plot_missing" = list(),
  "plot_histogram" = list(),
  "plot_density" = list(),
  "plot_qq" = list(sampled_rows = 1000L),
  "plot_bar" = list(),
  "plot_correlation" = list("cor_args" = list("use" = "pairwise.complete.obs")),
  "plot_prcomp" = list(),
  "plot_boxplot" = list(),
  "plot_scatterplot" = list(sampled_rows = 1000L)
)
## End(Not run)
```

drop_columns

Drop selected variables

Description

Quickly drop variables by either column names or positions.

Usage

```
drop_columns(data, ind)
```

8 dummify

Arguments

data input data

ind a vector of either names or column positions of the variables to be dropped.

Details

This function updates data.table object directly. Otherwise, output data will be returned matching input object class.

Examples

```
# Load packages
library(data.table)
# Generate data
dt <- data.table(sapply(setNames(letters, letters), function(x) {assign(x, rnorm(10))}))</pre>
dt2 <- copy(dt)
# Drop variables by name
names(dt)
drop_columns(dt, letters[2L:25L])
names(dt)
# Drop variables by column position
names(dt2)
drop_columns(dt2, seq(2, 25))
names(dt2)
# Return from non-data.table input
df <- data.frame(sapply(setNames(letters, letters), function(x) {assign(x, rnorm(10))}))</pre>
drop_columns(df, letters[2L:25L])
```

dummify

Dummify discrete features to binary columns

Description

Data dummification is also known as one hot encoding or feature binarization. It turns each category to a distinct column with binary (numeric) values.

Usage

```
dummify(data, maxcat = 50L, select = NULL)
```

Arguments

data input data

maximum categories allowed for each discrete feature. Default is 50.

select names of selected features to be dummified. Default is NULL.

group_category 9

Details

 $Continuous\ features\ will\ be\ ignored\ if\ added\ in\ select.$

select features will be ignored if categories exceed maxcat.

Value

dummified dataset (discrete features only) preserving original features. However, column order might be different.

Note

This is different from model.matrix, where the latter aims to create a full rank matrix for regression-like use cases. If your intention is to create a design matrix, use model.matrix instead.

Examples

```
## Dummify iris dataset
str(dummify(iris))

## Dummify diamonds dataset ignoring features with more than 5 categories
data("diamonds", package = "ggplot2")
str(dummify(diamonds, maxcat = 5))
str(dummify(diamonds, select = c("cut", "color")))
```

group_category

Group categories for discrete features

Description

Sometimes discrete features have sparse categories. This function will group the sparse categories for a discrete feature based on a given threshold.

Usage

```
group_category(
  data,
  feature,
  threshold,
  measure,
  update = FALSE,
  category_name = "OTHER",
  exclude = NULL
)
```

10 group_category

Arguments

data input data

feature name of the discrete feature to be collapsed.

threshold the bottom x% categories to be grouped, e.g., if set to 20%, categories with

cumulative frequency of the bottom 20% will be grouped

measure name of feature to be used as an alternative measure.

update logical, indicating if the data should be modified. The default is FALSE. Setting

to TRUE will modify the input data.table object directly. Otherwise, input class

will be returned.

category_name name of the new category if update is set to TRUE. The default is "OTHER".

exclude categories to be excluded from grouping when update is set to TRUE.

Details

If a continuous feature is passed to the argument feature, it will be force set to character-class.

Value

If update is set to FALSE, returns categories with cumulative frequency less than the input threshold. The output class will match the class of input data. If update is set to TRUE, updated data will be returned, and the output class will match the class of input data.

```
# Load packages
library(data.table)
# Generate data
data <- data.table("a" = as.factor(round(rnorm(500, 10, 5))), "b" = rexp(500, 500))</pre>
# View cumulative frequency without collpasing categories
group_category(data, "a", 0.2)
# View cumulative frequency based on another measure
group_category(data, "a", 0.2, measure = "b")
# Group bottom 20% categories based on cumulative frequency
group_category(data, "a", 0.2, update = TRUE)
plot_bar(data)
# Exclude categories from being grouped
dt <- data.table("a" = c(rep("c1", 25), rep("c2", 10), "c3", "c4"))
group_category(dt, "a", 0.8, update = TRUE, exclude = c("c3", "c4"))
plot_bar(dt)
# Return from non-data.table input
df <- data.frame("a" = as.factor(round(rnorm(50, 10, 5))), "b" = rexp(50, 10))</pre>
group_category(df, "a", 0.2)
group_category(df, "a", 0.2, measure = "b", update = TRUE)
group_category(df, "a", 0.2, update = TRUE)
```

introduce 11

introduce

Describe basic information

Description

Describe basic information for input data.

Usage

```
introduce(data)
```

Arguments

data

input data

Value

Describe basic information in input data class:

- rows: number of rows
- columns: number of columns
- discrete_columns: number of discrete columns
- continuous_columns: number of continuous columns
- all_missing_columns: number of columns with everything missing
- total_missing_values: number of missing observations
- complete_rows: number of rows without missing values. See complete.cases.
- total_observations: total number of observations
- memory_usage: estimated memory allocation in bytes. See object.size.

```
introduce(mtcars)
```

12 plot_bar

plot_bar Plot bar chart

Description

Plot bar chart for each discrete feature, based on either frequency or another continuous feature.

Usage

```
plot_bar(
   data,
   with = NULL,
   maxcat = 50,
   order_bar = TRUE,
   binary_as_factor = TRUE,
   title = NULL,
   ggtheme = theme_gray(),
   theme_config = list(),
   nrow = 3L,
   ncol = 3L,
   parallel = FALSE
)
```

Arguments

data input data name of continuous feature to be summed. Default is NULL, i.e., frequency. with maxcat maximum categories allowed for each feature. Default is 50. order_bar logical, indicating if bars should be ordered. Default is TRUE. binary_as_factor treat binary as categorical? Default is TRUE. title plot title ggtheme complete ggplot2 themes. Default is theme_gray. theme_config a list of configurations to be passed to theme number of rows per page. Default is 3. nrow ncol number of columns per page. Default is 3. enable parallel? Default is FALSE. parallel

Details

If a discrete feature contains more categories than maxcat specifies, it will not be passed to the plotting function.

plot_boxplot 13

Value

invisibly return the named list of ggplot objects

Examples

```
# Plot bar charts for diamonds dataset
library(ggplot2)
plot_bar(diamonds)
plot_bar(diamonds, maxcat = 5)
# Plot bar charts with `price` feature
plot_bar(diamonds, with = "price")
```

plot_boxplot

Create boxplot for continuous features

Description

This function creates boxplot for each continuous feature based on a selected feature.

Usage

```
plot_boxplot(
   data,
   by,
   binary_as_factor = TRUE,
   geom_boxplot_args = list(),
   scale_y = "continuous",
   title = NULL,
   ggtheme = theme_gray(),
   theme_config = list(),
   nrow = 3L,
   ncol = 4L,
   parallel = FALSE
)
```

Arguments

```
data input data

by feature name to be broken down by. If selecting a continuous feature, boxplot will be grouped by 5 equal ranges, otherwise, all existing categories for a discrete feature.

binary_as_factor
treat binary as categorical? Default is TRUE.

geom_boxplot_args
a list of other arguments to geom_boxplot
```

plot_correlation

```
scale_y scale of original y axis (before coord_flip). See scale_y_continuous for all options. Default is continuous.

title plot title
ggtheme complete ggplot2 themes. The default is theme_gray.
theme_config a list of configurations to be passed to theme.
nrow number of rows per page
ncol number of columns per page
parallel enable parallel? Default is FALSE.
```

Value

invisibly return the named list of ggplot objects

See Also

```
geom_boxplot
```

Examples

```
plot_boxplot(iris, by = "Species", ncol = 2L)
plot_boxplot(iris, by = "Species", geom_boxplot_args = list("outlier.color" = "red"))
# Plot skewed data on log scale
set.seed(1)
skew <- data.frame(y = rep(c("a", "b"), 500), replicate(4L, rbeta(1000, 1, 5000)))
plot_boxplot(skew, by = "y", ncol = 2L)
plot_boxplot(skew, by = "y", scale_y = "log10", ncol = 2L)</pre>
```

plot_correlation

Create correlation heatmap for discrete features

Description

This function creates a correlation heatmap for all discrete categories.

Usage

```
plot_correlation(
   data,
   type = c("all", "discrete", "continuous"),
   maxcat = 20L,
   cor_args = list(),
   geom_text_args = list(),
   title = NULL,
   ggtheme = theme_gray(),
   theme_config = list(legend.position = "bottom", axis.text.x = element_text(angle = 90))
)
```

plot_density 15

Arguments

data input data

type column type to be included in correlation calculation. "all" for all columns,

"discrete" for discrete features, "continuous" for continuous features.

maximum categories allowed for each discrete feature. The default is 20.

cor_args a list of other arguments to cor

geom_text_args a list of other arguments to geom_text

title plot title

ggtheme complete ggplot2 themes. The default is theme_gray.

theme_config a list of configurations to be passed to theme.

Details

For discrete features, the function first dummifies all categories, then calculates the correlation matrix (see cor) and plots it.

Value

invisibly return the ggplot object

Examples

```
plot_correlation(iris)
plot_correlation(iris, type = "c")
plot_correlation(airquality, cor_args = list("use" = "pairwise.complete.obs"))
```

plot_density

Plot density estimates

Description

Plot density estimates for each continuous feature

Usage

```
plot_density(
  data,
  binary_as_factor = TRUE,
  geom_density_args = list(),
  scale_x = "continuous",
  title = NULL,
  ggtheme = theme_gray(),
  theme_config = list(),
  nrow = 4L,
  ncol = 4L,
  parallel = FALSE
)
```

plot_histogram

Arguments

```
data
                  input data
binary_as_factor
                  treat binary as categorical? Default is TRUE.
geom_density_args
                  a list of other arguments to geom_density
                  scale of x axis. See scale_x_continuous for all options. Default is continuous.
scale_x
title
                  plot title
                  complete ggplot2 themes. The default is theme_gray.
ggtheme
theme_config
                  a list of configurations to be passed to theme.
                  number of rows per page. Default is 4.
nrow
                  number of columns per page. Default is 4.
ncol
parallel
                  enable parallel? Default is FALSE.
```

Value

invisibly return the named list of ggplot objects

See Also

```
geom_density plot_histogram
```

Examples

```
# Plot iris data
plot_density(iris, ncol = 2L)

# Add color to density area
plot_density(iris, geom_density_args = list("fill" = "black", "alpha" = 0.6), ncol = 2L)

# Plot skewed data on log scale
set.seed(1)
skew <- data.frame(replicate(4L, rbeta(1000, 1, 5000)))
plot_density(skew, ncol = 2L)
plot_density(skew, scale_x = "log10", ncol = 2L)</pre>
```

plot_histogram

Plot histogram

Description

Plot histogram for each continuous feature

plot_histogram 17

Usage

```
plot_histogram(
  data,
  binary_as_factor = TRUE,
  geom_histogram_args = list(bins = 30L),
  scale_x = "continuous",
  title = NULL,
  ggtheme = theme_gray(),
  theme_config = list(),
  nrow = 4L,
  ncol = 4L,
  parallel = FALSE
)
```

Arguments

```
data
                  input data
binary_as_factor
                  treat binary as categorical? Default is TRUE.
geom_histogram_args
                  a list of other arguments to geom_histogram
scale_x
                  scale of x axis. See scale_x_continuous for all options. Default is continuous.
title
                  plot title
ggtheme
                  complete ggplot2 themes. The default is theme_gray.
theme_config
                  a list of configurations to be passed to theme.
nrow
                  number of rows per page. Default is 4.
                  number of columns per page. Default is 4.
ncol
parallel
                  enable parallel? Default is FALSE.
```

Value

invisibly return the named list of ggplot objects

See Also

```
geom_histogram plot_density
```

```
# Plot iris data
plot_histogram(iris, ncol = 2L)

# Plot skewed data on log scale
set.seed(1)
skew <- data.frame(replicate(4L, rbeta(1000, 1, 5000)))
plot_histogram(skew, ncol = 2L)
plot_histogram(skew, scale_x = "log10", ncol = 2L)</pre>
```

plot_intro

 $plot_intro$

Plot introduction

Description

Plot basic information (from introduce) for input data.

Usage

```
plot_intro(
  data,
  geom_label_args = list(),
  title = NULL,
  ggtheme = theme_gray(),
  theme_config = list()
)
```

Arguments

Value

invisibly return the ggplot object

See Also

introduce

```
plot_intro(airquality)
plot_intro(iris)
```

plot_missing 19

plot_missing

Plot missing value profile

Description

This function returns and plots frequency of missing values for each feature.

Usage

```
plot_missing(
  data,
  group = list(Good = 0.05, OK = 0.4, Bad = 0.8, Remove = 1),
  missing_only = FALSE,
  geom_label_args = list(),
  title = NULL,
  ggtheme = theme_gray(),
  theme_config = list(legend.position = c("bottom"))
)
```

Arguments

Value

invisibly return the ggplot object

See Also

```
profile_missing
```

```
plot_missing(airquality)
plot_missing(airquality, missing_only = TRUE)

## Customize band
plot_missing(airquality, group = list("B1" = 0, "B2" = 0.06, "B3" = 1))
```

20 plot_prcomp

```
## Shrink geom_label size
library(ggplot2)
plot_missing(airquality, geom_label_args = list("size" = 2, "label.padding" = unit(0.1, "lines")))
```

plot_prcomp

Visualize principal component analysis

Description

Visualize output of prcomp.

Usage

```
plot_prcomp(
  data,
  variance_cap = 0.8,
  maxcat = 50L,
  prcomp_args = list(scale. = TRUE),
  geom_label_args = list(),
  title = NULL,
  ggtheme = theme_gray(),
  theme_config = list(),
  nrow = 3L,
  ncol = 3L,
  parallel = FALSE
)
```

Arguments

data input data

variance_cap maximum cumulative explained variance allowed for all principal components.

Default is 80%.

maxcat maximum categories allowed for each discrete feature. The default is 50.

prcomp_args a list of other arguments to prcomp

geom_label_args

a list of other arguments to geom_label

title plot title starting from page 2.

ggtheme complete ggplot2 themes. The default is theme_gray.

theme_config a list of configurations to be passed to theme.

nrow number of rows per page
ncol number of columns per page
parallel enable parallel? Default is FALSE.

plot_qq 21

Details

When cumulative explained variance exceeds variance_cap, remaining principal components will be ignored. Set variance_cap to 1 for all principal components.

Discrete features containing more categories than maxcat specifies will be ignored.

Value

invisibly return the named list of ggplot objects

Note

Discrete features will be dummify-ed first before passing to prcomp.

Missing values may create issues in prcomp. Consider na.omit your input data first.

Features with zero variance are dropped.

Examples

```
plot_prcomp(na.omit(airquality), nrow = 2L, ncol = 2L)
```

plot_qq

Plot QQ plot

Description

Plot quantile-quantile for each continuous feature

Usage

```
plot_qq(
   data,
   by = NULL,
   sampled_rows = nrow(data),
   geom_qq_args = list(),
   geom_qq_line_args = list(),
   title = NULL,
   ggtheme = theme_gray(),
   theme_config = list(),
   nrow = 3L,
   ncol = 3L,
   parallel = FALSE
)
```

22 plot_scatterplot

Arguments

data	input data			
by	feature name to be broken down by. If selecting a continuous feature, it will be grouped by 5 equal ranges, otherwise, all existing categories for a discrete feature. Default is NULL.			
sampled_rows	number of rows to sample if data has too many rows. Default is all rows, which means do not sample.			
geom_qq_args	a list of other arguments to geom_qq			
<pre>geom_qq_line_args</pre>				
	a list of other arguments to geom_qq_line			
title	plot title			
ggtheme	complete ggplot2 themes. Default is theme_gray.			
theme_config	a list of configurations to be passed to theme			
nrow	number of rows per page. Default is 3.			
ncol	number of columns per page. Default is 3.			
parallel	enable parallel? Default is FALSE.			

Value

invisibly return the named list of ggplot objects

Examples

```
plot_qq(iris)
plot_qq(iris, by = "Species", ncol = 2L)

plot_qq(
   data = airquality,
   geom_qq_args = list(na.rm = TRUE),
   geom_qq_line_args = list(na.rm = TRUE)
)
```

plot_scatterplot

Create scatterplot for all features

Description

This function creates scatterplot for all features fixing on a selected feature.

plot_scatterplot 23

Usage

```
plot_scatterplot(
  data,
  by,
  sampled_rows = nrow(data),
  geom_point_args = list(),
  scale_x = NULL,
  scale_y = NULL,
  title = NULL,
  ggtheme = theme_gray(),
  theme_config = list(),
  nrow = 3L,
  ncol = 3L,
  parallel = FALSE
)
```

Arguments

data input data feature name to be fixed at by number of rows to sample if data has too many rows. Default is all rows, which sampled_rows means do not sample. geom_point_args a list of other arguments to geom_point scale of original x axis (before coord_flip). See scale_x_continuous for all scale_x options. Default is NULL. scale of original y axis (before coord_flip). See scale_y_continuous for all scale_y options. Default is NULL. title plot title complete ggplot2 themes. The default is theme_gray. ggtheme theme_config a list of configurations to be passed to theme. number of rows per page nrow number of columns per page ncol parallel enable parallel? Default is FALSE.

Value

invisibly return the named list of ggplot objects

See Also

```
geom_point
```

plot_str

Examples

```
plot_scatterplot(iris, by = "Species")
# Plot skewed data on log scale
set.seed(1)
skew <- data.frame(replicate(5L, rbeta(1000, 1, 5000)))</pre>
plot_scatterplot(skew, by = "X5", ncol = 2L)
plot_scatterplot(skew, by = "X5", scale_x = "log10", scale_y = "log10", ncol = 2L)
## Not run:
# Customize themes
library(ggplot2)
plot_scatterplot(
  data = mpg,
  by = "hwy",
  geom_point_args = list(size = 1L),
  theme_config = list("axis.text.x" = element_text(angle = 90)),
  ncol = 4L
)
## End(Not run)
```

 $plot_str$

Visualize data structure

Description

Visualize data structures in D3 network graph

Usage

```
plot_str(
  data,
  type = c("diagonal", "radial"),
  max_level = NULL,
  print_network = TRUE,
  ...
)
```

Arguments

data input data

type type of network diagram. Defaults to diagonalNetwork.

max_level integer threshold of nested level to be visualized. Minimum 1 nested level and

defaults to all.

print_network logical indicating if network graph should be plotted. Defaults to TRUE.

... other arguments to be passed to plotting functions. See diagonalNetwork and

radialNetwork.

profile_missing 25

Value

input data structure in nested list. Could be transformed to json format with most JSON packages.

See Also

str

Examples

```
## Visualize structure of iris dataset
plot_str(iris)

## Visualize object with radial network
plot_str(rep(list(rep(list(mtcars), 6)), 4), type = "r")

## Generate complicated data object
obj <- list(
    "a" = list(iris, airquality, list(mtcars = mtcars, USArrests = USArrests)),
    "b" = list(list(ts(1:10, frequency = 4))),
    "c" = lm(rnorm(5) ~ seq(5)),
    "d" = lapply(1:5, function(x) return(as.function(function(y) y + 1)))
)

## Visualize data object with diagnal network
plot_str(obj, type = "d")
## Visualize only top 2 nested levels
plot_str(obj, type = "d", max_level = 2)</pre>
```

profile_missing

Profile missing values

Description

Analyze missing value profile

Usage

```
profile_missing(data)
```

Arguments

data

input data

Value

missing value profile, such as frequency, percentage and suggested action.

See Also

```
plot_missing
```

26 set_missing

Examples

```
profile_missing(airquality)
```

set_missing

Set all missing values to indicated value

Description

Quickly set all missing values to indicated value.

Usage

```
set_missing(data, value, exclude = NULL)
```

Arguments

data input data, in data.table format only.

value a single value or a list of two values to be set to. See 'Details'.

exclude column index or name to be excluded.

Details

The class of value will determine what type of columns to be set, e.g., if value is 0, then missing values for continuous features will be set. When supplying a list of two values, only one numeric and one non-numeric is allowed.

This function updates data.table object directly. Otherwise, output data will be returned matching input object class.

```
# Load packages
library(data.table)

# Generate missing values in iris data
dt <- data.table(iris)
for (j in 1:4) set(dt, i = sample.int(150, j * 30), j, value = NA_integer_)
set(dt, i = sample.int(150, 25), 5L, value = NA_character_)

# Set all missing values to 0L and unknown
dt2 <- copy(dt)
set_missing(dt2, list(0L, "unknown"))

# Set missing numerical values to 0L
dt3 <- copy(dt)
set_missing(dt3, 0L)

# Set missing discrete values to unknown
dt4 <- copy(dt)</pre>
```

split_columns 27

```
set_missing(dt4, "unknown")

# Set missing values excluding some columns
dt5 <- copy(dt)
set_missing(dt4, 0L, 1L:2L)
set_missing(dt4, 0L, names(dt5)[3L:4L])

# Return from non-data.table input
set_missing(airquality, 999999L)</pre>
```

split_columns

Split data into discrete and continuous parts

Description

This function splits the input data into two data.table objects: discrete and continuous. A feature is continuous if is.numeric returns TRUE.

Usage

```
split_columns(data, binary_as_factor = FALSE)
```

Arguments

```
data input data
binary_as_factor
treat binary as categorical? Default is FALSE.
```

Details

Features with all missing values will be dropped from the output data, but will be counted towards the column count.

The elements in the output list will have the same class as the input data.

Value

```
discrete all discrete features
continous all continuous features
num_discrete number of discrete features
num_continuous number of continuous features
num_all_missing number of features with no observations (all values are missing)
```

28 update_columns

Examples

```
output <- split_columns(iris)
output$discrete
output$continuous
output$num_discrete
output$num_continuous
output$num_all_missing</pre>
```

update_columns

Update variable types or values

Description

Quickly update selected variables using column names or positions.

Usage

```
update_columns(data, ind, what)
```

Arguments

data input data

a vector of either names or column positions of the variables to be dropped.

what either a function or a non-empty character string naming the function to be

called. See do.call.

Details

This function updates data.table object directly. Otherwise, output data will be returned matching input object class.

```
str(update_columns(iris, 1L, as.factor))
str(update_columns(iris, c("Sepal.Width", "Petal.Length"), "as.integer"))
## Apply log transformation to all columns
summary(airquality)
summary(update_columns(airquality, names(airquality), log))
## Force set factor to numeric
df <- data.frame("a" = as.factor(sample.int(10L)))
str(df)
str(update_columns(df, "a", function(x) as.numeric(levels(x))[x]))</pre>
```
